

# Analytics Consolidation Decision

Platform Engineering · August 2026

---

# Approve the \$180K Metrio contract to replace three analytics tools

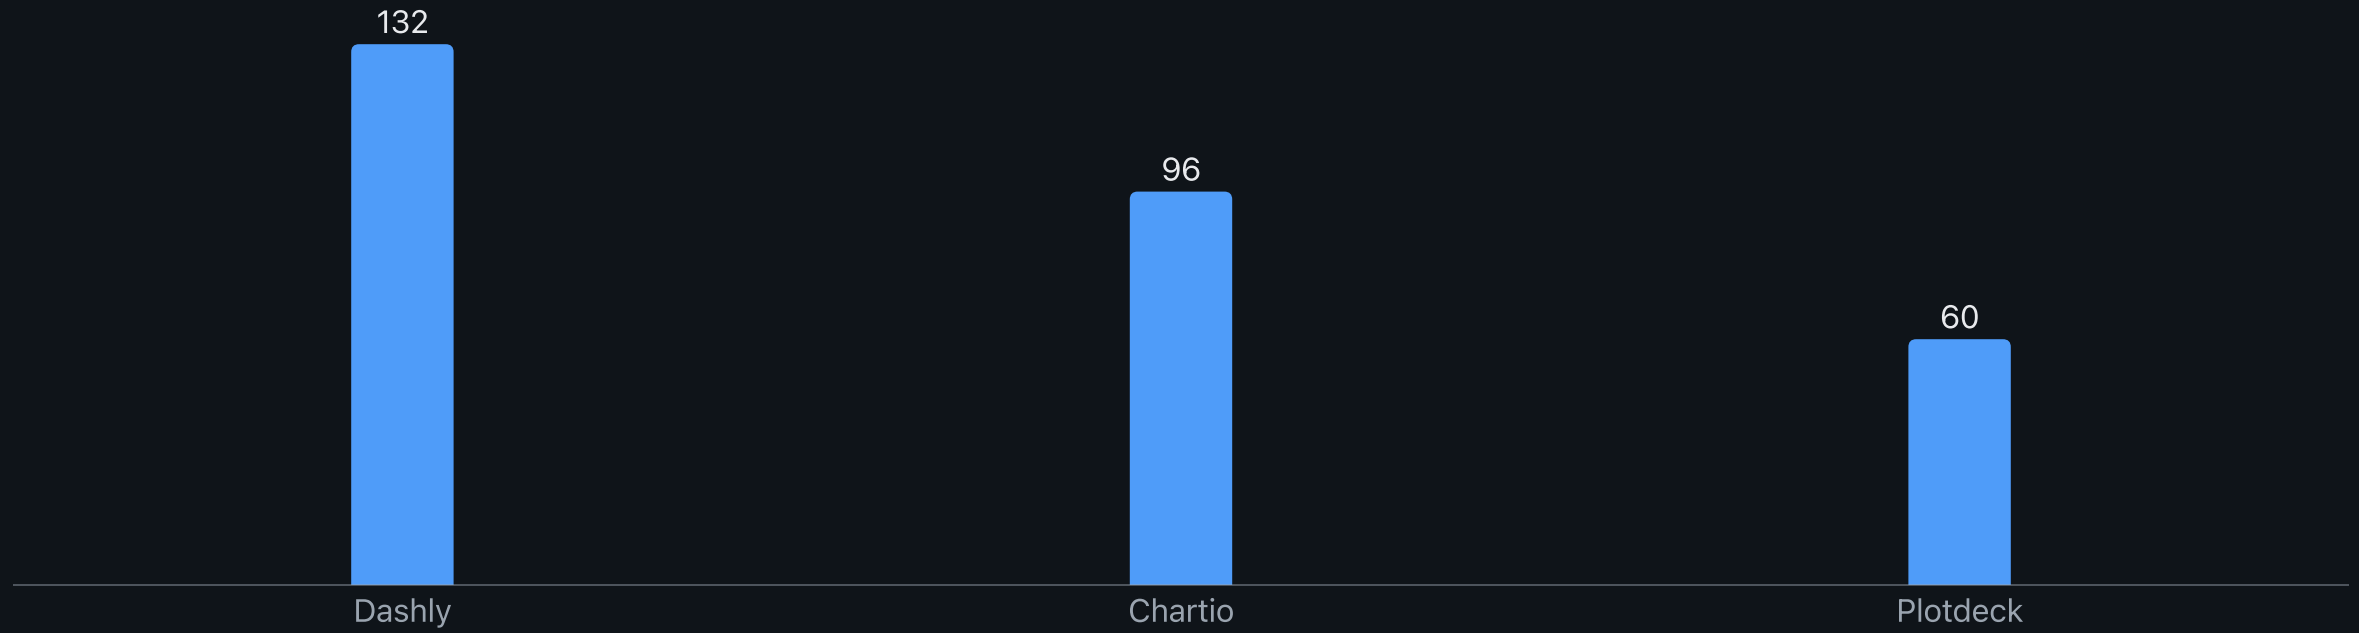

## \$108K

net annual saving after consolidation

breakeven in month 8

Two incumbent renewals auto-execute September 30 — the decision window is now.

# Analytics spend hits \$288K across three overlapping tools

Annual contract cost by tool (US\$K)

All three contracts renewed last year without a consolidation review.

# Six teams pay twice for the same dashboards

Seats duplicated across two or more tools, by team

Every new hire in these teams adds two licences by default.

# Metrio delivers 92% of current usage at 63% of the cost

## 92%

of tracked dashboard usage covered by Metrio

from 6 months of usage logs

- The uncovered 8% is legacy exports two teams already plan to retire
- \$180K flat contract replaces \$288K across three renewals
- Migration runs inside Q4 with no new headcount

# Two alternatives fall short on SSO and data residency

| Criterion                   | Metrio | Kepler BI            | Graphline |
|-----------------------------|--------|----------------------|-----------|
| SAML SSO included           | Yes    | Enterprise tier only | Yes       |
| EU data residency           | Yes    | Yes                  | No        |
| Annual cost (like-for-like) | \$180K | \$214K               | \$168K    |
| Usage coverage              | 92%    | 88%                  | 71%       |

# We need signatures before the September 30 renewal deadlines

Dashly and Chartio renew automatically Sept 30; cancellation needs 30 days' notice.

Signing by September 1 avoids a full year of double payment on two of the three tools. The ask: approve the Metrio contract and authorise the two cancellations.

# Migration runs eight weeks with the existing team

- Weeks 1–2: SSO, workspace setup, top-20 dashboards rebuilt
- Weeks 3–6: team-by-team migration, old tools read-only
- Weeks 7–8: legacy export retirement and cancellation notices
- Rollback point: end of week 4, before read-only cutover
